## Description

The present invention relates to novel indolylguanidine derivatives. The present invention also relates to sodium/proton ( $\text{Na}^+/\text{H}^+$ ) exchanger inhibitors comprising the indolylguanidine derivatives as the active component which are useful for the treatment and prevention of diseases caused by increased sodium/proton ( $\text{Na}^+/\text{H}^+$ ) exchanger activity.

Certain polycyclic aroylguanidine derivatives are known as those having polycondensed rings, for example, a naphthalene, 9,10-dihydroanthracene, benzofuran, 2,3-dihydrobenzofuran, benzothiophene, benzothiazole, methylenedioxybenzene, pyridothiophene, pyrimidothiophene, quinoline, 1,6-naphthylidine, 1,8-naphthylidine, 3,4-dihydrobenzopyran, 3,4-dihydroquinazolin-4-one, 1,2,3,4-tetrahydroquinazolin-2-one, quinoxaline, 5,6,7,8-tetrahydroquinoxaline, benzoazepine, benzotriazepine, benzimidazolothiazine, benzopyranopyran or benzocarbazole ring. As one of the aroylguanidine derivatives having indole rings there is known 1-guanidino-carbonyltryptophane but this compound is merely registered in Chemical Abstracts under Registered No. 18322-34-4, without any reference to its source.

Turning to some monocyclic aroylguanidine derivatives, pyrazinoylguanidine derivatives represented by, e.g., Amiloride, are known to exhibit the sodium/proton ( $\text{Na}^+/\text{H}^+$ ) exchanger inhibition activity and anti-arrhythmic activity, cf., J. Membrane Biol., Vol. 105, 1 (1988); and Circulation, Vol. 79, 1257 (1989). Recent reports also reveal that benzoylguanidine derivatives possess the sodium/proton ( $\text{Na}^+/\text{H}^+$ ) exchanger inhibition and anti-arrhythmic activities, cf., J. Mol. Cell. Cardiol., Vol. 24, Suppl. I, S. 92 (1992); *ibid.*, Vol. 24, Suppl. I, S. 117 (1992); and Japanese Patent KOKAI Nos. 3-106858 and 5-339228.

An object of the present invention is to provide novel indolylguanidine derivatives which inhibit the sodium/proton ( $\text{Na}^+/\text{H}^+$ ) exchanger activity and are therefore useful for the treatment and prevention of diseases caused by increased sodium/proton ( $\text{Na}^+/\text{H}^+$ ) exchanger activity, for example, hypertension, arrhythmia, angina pectoris, cardiac hypertrophy, diabetes mellitus, organ disorders associated with ischemia or ischemic reperfusion such as cardiac ischemic reperfusion injury (e.g., heart muscle ischemic reperfusion-associated disorders, acute renal failure, disorders induced by surgical treatment such as organ transplantation or percutaneous transluminal coronary angioplasty (PTCA), cerebro-ischemic disorders such as disorders associated with cerebral infarction, disorders caused after cerebral apoplexy as sequelae, or cerebral edema; or diseases caused by excessive cell proliferation such as proliferation of fibroblast, proliferation of smooth muscle cells or proliferation of mesangium cells, which diseases are, e.g., atherosclerosis, pulmonary fibrosis, hepatic fibrosis, renal fibrosis, glomerular nephrosclerosis, organ hypertrophy, prostatic hypertrophy, diabetic complications or recurrent stricture after PTCA, or diseases caused by endothelial cell injury.

Another object of the present invention is to provide compositions comprising the indolylguanidine derivatives as the active component which inhibit the sodium/proton ( $\text{Na}^+/\text{H}^+$ ) exchanger activity and are useful for the prevention and treatment of diseases caused by abnormal sodium/proton ( $\text{Na}^+/\text{H}^+$ ) exchanger activity.

may contain other hetero atom(s) therein; and the ring of

is a 3- to 8-membered saturated aliphatic ring or saturated hetero ring containing one nitrogen atom. The compounds of the present invention represented by the formula (1) above can be prepared by the following processes.

(a) The compounds (1) of the present invention can be obtained by reacting reactive derivatives of indolecarboxylic acid shown by formula (3) with guanidine in an inert solvent.

wherein X is a leaving group which can be readily replaced by a nucleophilic reagent and, R<sub>1</sub> and R<sub>2</sub> have the same significance as described above.

In this reaction, where the indolecarboxylic acid derivatives (3) contain reactive groups such as hydroxy or amino, these groups are previously protected by their protective groups. These protective groups are removed after the reaction is completed. The desired indolylguanidine derivatives (1) can thus be prepared.

As the reactive derivatives of the carboxylic acid, there are acid halides, acid anhydrides (including mixed acid anhydrides) and ester derivatives. Specific examples are acid chlorides and acid bromides as the acid halides; as the mixed acid anhydrides, there are mixed acid anhydrides with alkyloxy chloride type such as ethyloxycarbonyl chloride or isobutyloxycarbonyl chloride and those with  $\alpha$ -polyalkyl-substituted carboxylate type such as diethylacetyl chloride or trimethylacetyl chloride; as the ester derivatives there are activated esters such as p-nitrophenyl esters, N-hydroxysuccinimide esters or pentafluorophenyl esters, and ordinary esters such as methyl esters or ethyl esters. These reactive derivatives of the carboxylic acids can be readily obtained from the corresponding carboxylic acids in a conventional manner.

In the case of performing the reaction between the acid halides or the acid anhydrides (including the mixed acid anhydrides) and guanidine, the reaction can be carried out in a solvent under cooling or at room temperature, in the presence of a base or an excess of guanidine. Inorganic bases such as sodium hydroxide, potassium hydroxide, sodium carbonate, potassium carbonate or sodium hydrogencarbonate, or organic bases such as triethylamine or pyridine may be used as the base. Examples of the solvent include aromatic hydrocarbons such as benzene, toluene or xylene, ethers such as tetrahydrofuran or 1,4-dioxane, halogenated hydrocarbons such as dichloromethane, chloroform or 1,2-dichloro-ethane, amides such as dimethylformamide or dimethyl-acetamide, basic solvents such as pyridine, or a mixture of these solvents.

Where the ester derivatives are reacted, the reaction is carried out in a solvent usually at an elevated temperature, in the presence of an equimolar amount of or an excess of guanidine. In the case of using the activated esters, the reaction is performed preferably in an ethers such as tetrahydrofuran, 1,2-dimethoxyethane or 1,4-dioxane, an ester type solvent such as ethyl acetate, dimethylformamide or a solvent mixture thereof. In the case of using other esters, it is preferred to perform the reaction in an alcohol type solvent such as methanol, ethanol or isopropanol, an ether type solvent such as tetrahydrofuran, 1,2-dimethoxyethane or 1,4-dioxane, dimethylformamide or a solvent mixture thereof. After removal of the solvent, if necessary and desired, the reaction system may be heated at about 130°C for a short period of time.

(b) The compounds (1) of the present invention can be obtained by reacting indolecarboxylic acids shown by formula (4) with guanidine in an inert solvent at room temperature or with heating, preferably in the presence of a condensing agent.

wherein R<sub>1</sub> and R<sub>2</sub> have the same significance as described above.

In this reaction, where the indolecarboxylic acid derivatives (4) contain reactive groups such as hydroxy or amino, these groups are previously protected by their protective groups. These protective groups are removed after the reaction is completed. The desired indolylguanidine derivatives (1) can thus be prepared.

The reaction is carried out in a solvent, e.g., aromatic hydrocarbons such as benzene, toluene or xylene, ethers such as tetrahydrofuran or 1,4-dioxane, halogenated hydrocarbons such as dichloromethane, chloroform or 1,2-dichloroethane, amides such as dimethylformamide or dimethylacetamide, basic solvents such as pyridine, or a mixture of these solvents, in the presence of a condensing agent, e.g., dicyclohexylcarbodiimide (DCC), diisopropylcarbodiimide (DIPC), 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide (WSC), benzotriazol-1-yl-tris(dimethylamino)phosphonium hexafluorophosphate (BOP), diphenylphosphonyl azide (DPPA) or N,N-carbonyldiimidazole, cf., Angew. Chem. Int. Ed. Engl., Vol. 1, 351 (1962), and, if desired, in the presence of an additive such as N-hydroxysuccinimide (HONSu), 1-hydroxybenzotriazole (HOBt), 3-hydroxy-4-oxo-3,4-dihydro-1,2,3-benzotriazine (HOObt), etc.

(c) The compounds (1a) of the present invention can be obtained by debenzoylation of benzyloxyindolylguanidine derivatives shown by general formula (5).

wherein R<sub>2</sub> has the same significance as described hereinabove.

The debenzoylation is carried out in a manner similar to the processes described in publications, such as catalytic hydrogenation using a palladium/carbon catalyst, cf., J. Chem. Soc., 1953, 4058 or decomposition under acidic conditions using hydrochloric acid/acetic acid, cf., J. Amer. Chem. Soc., Vol. 73, 5765 (1951).

(d) The compounds (1b) of the present invention can be obtained by reducing nitroindolylguanidine derivatives represented by formula (6).

wherein  $R_2$  has the same significance as described hereinabove.

As the reducing conditions applicable, there are conditions, e.g., reduction under acidic conditions using zinc, iron, tin or tin (II) chloride, cf., Ann., 641, 81 (1961), J. Amer. Chem. Soc., Vol. 66, 1781 (1944); reducing using sulfides such as sodium dithionite ( $\text{Na}_2\text{S}_2\text{O}_4$ ), cf., J. Amer. Chem. Soc., Vol. 72, 1361 (1950); catalytic hydrogenation using catalysts such as palladium/carbon, cf., Synth. Commun., 1 47 (1971) or Raney nickel, cf., Org. Synth., IV, 226 (1963).

As the protective groups for the hydroxy, amino or carboxyl group reactive with the reaction in the process (a) or (b) described hereinabove, there may be used protective groups conventionally used in the field of organic synthesis chemistry. Introduction and removal of these protective groups can be made in a conventional manner, e.g., Protective Groups in Organic Synthesis, John Wiley & Sons, 1991.

Examples of the protective group for the hydroxy group include methoxymethyl and tetrahydropyranyl. Examples of the protective group for the amino group include tert-butyloxycarbonyl and the like. These protective groups for the hydroxy group can be removed by conducting the reaction in a solvent such as hydrated methanol, hydrated ethanol or hydrated tetrahydrofuran in the presence of an acid, e.g., hydrochloric acid, sulfuric acid or acetic acid. The amino protective groups can be removed by performing the reaction in a solvent such as hydrated tetrahydrofuran, methylene chloride, chloroform or hydrated methanol, in the presence of an acid, e.g., hydrochloric acid or trifluoroacetic acid.

For protecting the carboxyl group, the protection is effected in the form of tert-butyl esters, ortho-esters or acid amides. Such protective groups are removed, in the case of the tert-butyl esters, e.g., by performing the reaction in a hydrated solvent in the presence of hydrochloric acid; in the case of the ortho-esters, the protective groups are removed, e.g., by treating the protected compounds with an acid in a solvent such as hydrated methanol, hydrated tetrahydrofuran or hydrated 1,2-dimethoxyethane and then with an alkali such as sodium hydroxide. In the case of the acid amides, the protective groups are removed, e.g., by conducting the reaction in a solvent such as water, hydrated methanol or hydrated tetrahydrofuran in the presence of an acid such as hydrochloric acid or sulfuric acid.

The indolecarboxylic acids which are the starting compounds in the processes (a) and (b) described hereinabove are commercially available. Examples of such commercially available indolecarboxylic acids are indole-5-carboxylic acid, 5-chloro-2-indole carboxylic acid, indole-3-carboxylic acid, indole-2 carboxylic acid, indole-4-carboxylic acid, 5-methoxy-2-indolecarboxylic acid. Alternatively, the indolecarboxylic acids may be prepared by known methods.

According to, e.g., the method of Reissert (Reissert's indole synthesis), there can be prepared 4-chloro-2-indolecarboxylic acid, cf., J. Chem. Soc., 1955, 3490; 6-n-amy-2-indolecarboxylic acid, cf., J. Amer. Chem. Soc., Vol. 75, 4921 (1953); 7-indolecarboxylic acid, cf., J. Amer. Chem. Soc., Vol. 77, 5700 (1955); 5-cyano-2-indolecarboxylic acid, cf., J. Org. Chem., Vol. 18, 354 (1953); 6-cyano-2-indolecarboxylic acid, cf., J. Chem. Soc., 1924, 2285; 6-benzyloxy-2-indolecarboxylic acid, cf., J. Chem. Soc., 1937, 1726 and the like.

The method of Fischer (Fischer's indole synthesis) gives nitro-2-indolecarboxylic acids in J. Amer. Chem. Soc., Vol. 80, 4621 (1958), 7-chloro-2-indolecarboxylic acid in J. Chem. Soc., 1955, 3499, 4-trifluoromethyl-2-indolecarboxylic acid in J. Amer. Chem. Soc., Vol. 79, 1745 (1957) and the like.

The 2-indolecarboxylic acids may also be prepared by known methods using benzaldehyde derivatives as the starting compounds, see, e.g., Tetrahedron, Vol. 42, 3259 (1986).

The 4-indolecarboxylic acids, 5-indole-carboxylic acids and 6-indolecarboxylic acids can be prepared based on the methods described in, e.g., J. Chem. Tech. Biotechnol., Vol. 36, 562 (1986), Tetrahedron Letters, Vol. 27, 1653 (1986), etc.

The 1-hydroxyindolecarboxylic acids can be prepared based on the method described in Chem. Ber., Vol. 56, 1024 (1923).

The aryloxyindolecarboxylic acids can be prepared by reacting alkali metal salts (e.g., sodium or potassium salts) of hydroxyindolecarboxylic acids with aryl halides in an inert solvent such as dimethyl-formamide or tetrahydrofuran in the presence or absence of a catalyst such as copper or copper iodide. In case that the aryl halide employed for the reaction contains a reactive group(s) such as carboxyl, hydroxy or amino, these groups may be previously protected with appropriate protective groups. Then the coupling reaction is carried out and the reaction with guanidine follows.

Thereafter the protective groups are removed to prepare the objective indolylguanidine derivatives. The other indole-carboxylic acids are either commercially available or may be prepared with reference to the synthesis methods described in reviews (1), (2) and (3) given below:

Preparation of 7-chloro-2-indolecarboxylic acid (Fischer's indole synthesis)

##### a) Preparation of ethyl 2-(2-chlorophenyl)hydrazonopropionate

To a solution of 14.4 g (0.10 mol) of ethyl 2-methylacetacetate in 100 ml of ethanol was added dropwise 50 g of 50% potassium hydroxide aqueous solution at 0°C. After 70 g of ice was added to the solution, a diazonium salt solution prepared by mixing 12.8 g (0.10 mol) of o-chloroaniline, 13.6 g (0.20 mol) of sodium nitrite and 60 g of conc. hydrochloric acid was added to the mixture at once. The reaction mixture was stirred at 0°C for 30 minutes. The precipitates were collected and dried under reduced pressure to give 9.10 g (37.7%) of the desired ethyl 2-(2-chlorophenyl)hydrazonopropionate.

##### b) Preparation of ethyl 7-chloro-2-indolecarboxylate

After 8.00 g (33.2 mmol) of ethyl 2-(2-chlorophenyl)hydrazonopropionate obtained above was added to 20 g of polyphosphoric acid, the mixture was gradually heated to 190°C, which was kept for 5 minutes. The reaction mixture was cooled to 60°C and water was then added thereto. The mixture was extracted three times with ethyl acetate. The combined extracts were washed with water. After drying over anhydrous magnesium sulfate, the solvent was distilled off under reduced pressure. The resulting residue was purified by silica gel column chromatography to obtain 3.40 g (45.7%) of the desired ethyl 7-chloro-2-indolecarboxylate.

Example 152

Preparation of 7-[(3-aminopropyl)amino]-1-methyl-2-indolylguanidine dihydrochloride

a) Preparation of ethyl 7-[(3-aminopropyl)amino]-1-methyl-2-indolecarboxylate

A mixture of 4.00 g (18.3 mmol) of ethyl 7-amino-1-methyl-2-indolecarboxylate, 7.60 g (37.6 mmol) of 3-(benzyloxycarbonylamino)propion aldehyde, 2.43 g (38.6 mmol) of sodium cyanoborohydride, 2.1 ml of acetic acid, 5.0 g of molecular sieves 3A and 200 ml of methanol was stirred at room temperature for 4.5 hours. After 28% ammonia water was added to the reaction solution to render the system alkaline, the reaction mixture was extracted three times with ethyl acetate. The combined extracts were then washed with saturated sodium chloride aqueous solution. After drying over anhydrous sodium sulfate, the solvent was distilled off under reduced pressure. The resulting residue was suspended in 100 ml of ethanol. After 6.40 g (101 mmol) of ammonium formate and 0.91 g of 10% palladium/carbon were added to the suspension, the mixture was heated to reflux for 8 hours. Insoluble matters were filtered off and the filtrate was concentrated under reduced pressure. The thus obtained residue was isolated and purified by silica gel column chromatography to give 1.04 g (24.6%) of ethyl 7-[(3-aminopropyl)amino]-1-methyl-2-indolecarboxylate.

b) Preparation of ethyl 7-[(3-tert-butoxycarbonylamino)propyl]amino]-1-methyl-2-indolecarboxylate

A mixture of 0.20 g (0.71 mmol) of ethyl 7-[(3-aminopropyl)amino]-1-methyl-2-indolecarboxylate, 0.17 g (0.79 mmol) of di-tert-butyl dicarbonate and 3 ml of dichloromethane was stirred at room temperature for an hour. The solvent was distilled off under reduced pressure. The residue was isolated and purified by silica gel column chromatography to give 0.25 g (91.6%) of ethyl 7-[(3-tert-butoxycarbonylamino)propyl]amino]-1-methyl-2-indolecarboxylate.

c) Preparation of 7-[(3-tert-butoxycarbonylamino)propyl]amino]-1-methyl-2-indolecarboxylic acid

A mixture of 0.12 g (0.31 mmol) of ethyl 7-[(3-tert-butoxycarbonylamino)propyl]amino]-1-methyl-2-indolecarboxy-

late, 2 ml of 5N potassium hydroxide aqueous solution and 5 ml of ethanol was stirred at room temperature for 2.5 hours. After 2N hydrochloric acid was gradually added to the reaction solution to render the pH 6, the reaction mixture was concentrated under reduced pressure. The residue was extracted three times with chloroform. The combined extracts were dried over anhydrous sodium sulfate. The solvent was then distilled off under reduced pressure. The resulting residue was isolated and purified by silica gel column chromatography to give 0.079 g (72.4%) of 7-[(3-tert-butoxycarbonylamino)propyl]amino]-1-methyl-2-indolecarboxylic acid.

d) Preparation of 7-[(3-tert-butoxycarbonylamino)propyl]amino]-1-methyl-2-indoloylguanidine

A solution of 0.068 g (0.18 mmol) of 7-[(3-tert-butoxycarbonylamino)propyl]amino]-1-methyl-2-indolecarboxylic acid and 0.088 g (0.54 mmol) of carbonyldiimidazole in 5 ml of tetrahydrofuran was stirred for 2 hours at room temperature and then at 45 to 50°C for an hour. After the temperature was reverted to ambient temperature, a solution of 0.10 g (1.08 mmol) of guanidine hydrochloride and 0.16 ml (1.15 mmol) of triethylamine in 5 ml of dimethylformamide was added to the reaction mixture followed by stirring at room temperature for 7 hours. The solvent was then distilled off under reduced pressure. The resulting residue was isolated and purified by silica gel column chromatography to give 0.043 g (61.2%) of 7-[(3-tert-butoxycarbonylamino)propyl]amino]-1-methyl-2-indoloylguanidine.

e) Preparation of 7-[(3-aminopropyl)amino]-1-methyl-2-indoloylguanidine dihydrochloride

After 0.04 g (0.10 mmol) of 7-[(3-tert-butoxycarbonylamino)propyl]amino]-1-methyl-2-indoloylguanidine was dissolved in 2 ml of hydrochloric acid/methanol, the solution was stirred at room temperature for 4 hours. The solvent was distilled off under reduced pressure. After 2N sodium hydroxide aqueous solution was added to the residue thus obtained, the mixture was extracted three times with chloroform. The combined extracts were dried over anhydrous sodium sulfate. The solvent was then distilled off under reduced pressure. The resulting residue was isolated and purified by silica gel column chromatography to give 0.023 g (80.0%) of 7-[(3-aminopropyl)amino]-1-methyl-2-indoloylguanidine. The guanidine derivative was converted into the hydrochloride with hydrochloric acid/methanol. Recrystallization from methanol gave 7-[(3-aminopropyl)amino]-1-methyl-2-indoloylguanidine dihydrochloride.

After cooling, 28% ammonia water was added to the reaction mixture and ethanol was then distilled off under reduced pressure. The residue was extracted three times with ethyl acetate. The combined extracts were then washed with saturated sodium chloride aqueous solution. After drying over anhydrous magnesium sulfate, the solvent was distilled off under reduced pressure. The resulting residue was isolated and purified by silica gel column chromatography to give 0.11 g (51.6%) of 6-(2-aminophenoxy)-4-chloro-1-methyl-2-indolylguanidine. ### Experiment 3

#### Inhibition of Ischemia- and Reperfusion-induced Arrhythmia in vivo

##### Method:

The experiment was performed by modifying the method of Crome et al. described in J. Cardiovasc. Pharmacol., 8, 1249 (1986). That is, the prevention of arrhythmia induced by reperfusion after rat coronary artery occlusion was evaluated by the incidence of ventricular tachycardia and ventricular fibrillation as well as the mortality.

##### Results:

The compound of Example 1 in the present invention was evaluated by the method described above, with respect to the incidence of ventricular tachycardia and ventricular fibrillation, and mortality. The results are shown in Table 3 below.
